

Video Scripts for Judges

Demo + Tech | max 60 seconds each | Speak English | App: localhost:3000

What judges want (hit all three)

1. Creativity — is the idea sharp and original?
2. Technical depth — is the code meaningful?
3. Presentation — is it clear and convincing?

Solve a real problem, show measurable impact, make it look good.

Creativity: readiness guide, not an eligibility oracle. Guided checklist instead of forcing users to invent questions.

Technical depth: OpenAI for allowlisted extraction; deterministic MTSP math in code; citations; refusal / injection / delete.

Presentation: three clear steps, plain language, visible dollars (\$56,316 vs \$72,000).

1) Demo Video — Creativity + Presentation

Do not open Judge/safety tools here. Household: Mara North.

Beat 1 · Presentation / Problem

SAY

Affordable housing applications stall on paperwork, not on people. CiteCheck helps renters get ready for review. We never decide who qualifies.

SHOW

Hero: CiteCheck title and subtitle. Tab 1 Your documents.

Beat 2 · Creativity

SAY

Our idea is simple and sharp: guide the renter, don't quiz them. Load official sample docs, read a pay stub, pull out the facts.

SHOW

Consent !' Mara North !' Load sample files !' Read this PDF.

Beat 3 · Presentation

SAY

You confirm or fix each value. What you save is what the packet uses.

SHOW

Mark all as looks right !' Save these facts.

Beat 4 · Creativity

SAY

Instead of forcing people to invent questions, we show what's done and what's still missing.

SHOW

Tab 2 What you need. Show checklist.

Beat 5 · Impact / Presentation

SAY

Then we build a clear packet: yearly income versus the published limit, plus next steps. Measurable, human-readable impact.

SHOW

Tab 3 !' Build my packet. Show dollar amounts.

Beat 6 · All three

SAY

CiteCheck: extract, guide, prepare. Look good, stay honest. A person decides.

SHOW

Freeze on packet + footer Help only.

2) Tech Video — Technical depth

Alternate Cursor and browser. Show meaningful code, not buzzwords.

Beat 1 · Technical depth

SAY

Under the hood, CiteCheck is real product engineering on the official RealDoor pack, not a thin chat wrapper.

SHOW

Folder data/organizer/realdoor-hackathon-starter-pack/

Beat 2 · Technical depth

SAY

Frozen FY2026 MTSP limits, a cited rule corpus, and synthetic PDFs with gold fields and source boxes.

SHOW

mtsp CSV or rules/rule_corpus.jsonl

Beat 3 · Technical depth

SAY

Next.js and TypeScript App Router APIs. OpenAI extracts only allowlisted fields from PDF text.

SHOW

src/app/api/

Beat 4 · Technical depth

SAY

The meaningful depth: income annualization and the 60% MTSP compare are deterministic code, matching the organizer calculator, not LLM math.

SHOW

src/lib/calculate.ts, then packet dollars in the browser

Beat 5 · Technical depth

SAY

Safety is implemented, not promised: eligibility refusal, prompt-injection resistance, and session deletion.

SHOW

Refusal in What you need, OR Safety checks Pass

Beat 6 · Technical depth + Creativity

SAY

Every field can cite page and bounding box evidence. Stack: Next.js, TypeScript, OpenAI, official RealDoor data. Human in the loop by design.

SHOW

Field evidence line !' freeze

Memorize (one line each)

Creativity: We built a readiness guide, not an eligibility oracle.

Technical depth: LLM for extraction; code for money math and safety.

Presentation: Three steps, plain language, numbers you can see.

Full Demo script (~58s)

Affordable housing applications stall on paperwork, not on people. CiteCheck helps renters get ready for review. We never decide who qualifies. The idea is sharp: guide the renter, don't quiz them. We load official sample documents, read a pay stub, and extract the facts. You confirm or fix each value. Then we show a checklist of what's done and what's still missing. Finally we build a packet with a yearly income estimate versus the published limit, and clear next steps. Extract, guide, prepare. A person decides.

Full Tech script (~58s)

Under the hood, CiteCheck is real product engineering on the official RealDoor pack, not a thin chat wrapper. We use frozen FY2026 MTSP limits, a cited rule corpus, and synthetic PDFs with gold fields and source boxes. The stack is Next.js and TypeScript. App Router APIs call OpenAI only for allowlisted extraction. The meaningful depth is deterministic income annualization and the sixty percent MTSP comparison in code, not in the model. Safety is implemented: eligibility refusal, prompt-injection resistance, and session deletion. Every field can cite page and bounding-box evidence. Next.js, OpenAI, official RealDoor data, human in the loop.
